Attracting Students to Computer Science Using Artificial Intelligence, Economics, and Linear Programming

> Vincent Conitzer Duke University

AI & Economics

- AI has always used techniques from economics
 - Herbert Simon
 - Probabilities, beliefs, utility, discounting, ...
- Last ~ decade+: AI research increasingly focused on multiagent systems, economics
 - Auctions, voting
 - Game theory
 - Mechanism design
- Conferences
 - Conference on Autonomous Agents and Multiagent Systems (AAMAS)
 - ACM Conference on Electronic Commerce (EC)
 - Also lots of work at IJCAI, AAAI, ...
 - Some at UAI, ICML, NIPS, ...
 - Other cs/econ conf's: COMSOC, WINE, SAGT, AMMA, TARK, ...

What is Economics?

- "the social science that is concerned with the production, distribution, and consumption of goods and services" [Wikipedia, June 2010]
- Some key concepts:
 - Economic agents or players (individuals, households, firms, ...)
 - Agents' current endowments of goods, money, skills, ...
 - Possible outcomes ((re)allocations of resources, tasks, ...)
 - Agents' preferences or utility functions over outcomes
 - Agents' beliefs (over other agents' utility functions, endowments, production possibilities, ...)
 - Agents' possible decisions/actions
 - Mechanism that maps decisions/actions to outcomes

An economic picture

After trade (a more efficient outcome)

Economic mechanisms

Teaching an introductory course

- Goals:
 - Expose computer science students to basic concepts from microeconomics, game theory
 - Expose economics students to basic concepts in programming, algorithms
 - Show how to increase economic efficiency using computation
- Cannot include whole intro programming course
- Solution: focus strictly on linear/integer programming
 - Can address many economics problems
 - Nice modeling languages that give flavor of programming
 - Computer science students have generally not been exposed to this either

Example linear program

 We make reproductions of two paintings

- Painting 1 sells for \$30, painting 2 sells for \$20
- Painting 1 requires 4 units of blue, 1 green, 1 red
- Painting 2 requires 2 blue, 2 green, 1 red
- We have 16 units blue, 8 green, 5 red

maximize 3x + 2y subject to $4x + 2y \le 16$ $x + 2y \le 8$ $x + y \leq 5$ $x \ge 0$ $y \ge 0$

Solving the linear program graphically

Modified LP

maximize
$$3x + 2y$$

subject to
 $4x + 2y \le 15$
 $x + 2y \le 8$
 $x + y \le 5$
 $x \ge 0$
 $y \ge 0$

Optimal solution: x = 2.5, y = 2.5Solution value = 7.5 + 5 = 12.5

Half paintings?

Integer (linear) program

Mixed integer (linear) program

General integer program formulation

maximize $\Sigma_{p \text{ in paintings}} V_p \mathbf{x}_p$ subject to for each color c, $\Sigma_{p \text{ in paintings}} q_{c,p} \mathbf{x}_p \leq a_c$ for each painting p, \mathbf{x}_p nonnegative integer The MathProg modeling language set PAINTINGS; set COLORS;

var quantity produced{j in PAINTINGS}, >=0, integer; param selling price{j in PAINTINGS}; param paint available{i in COLORS}; param paint_needed{i in COLORS, j in PAINTINGS}; maximize revenue: sum{j in PAINTINGS} selling price[j]*quantity produced[j]; s.t. enough paint{i in COLORS}: sum{j in PAINTINGS} paint needed[i,j]*quantity produced[j] <= paint available[i];

The MathProg modeling language

```
data;
set PAINTINGS := p1 p2;
set COLORS := blue green red;
param selling_price := p1 3 p2 2;
param paint_available := blue 15 green 8 red 5;
param paint_needed :
```

	p1	p2 :
blue	4	2
green	1	2
red	1	1;
end;		

A knapsack-type problem

- We arrive in a room full of precious objects
- Can carry only 30kg out of the room
- Can carry only 20 liters out of the room
- Want to maximize our total value
- Unit of object A: 16kg, 3 liters, sells for \$11
 There are 3 units available
- Unit of object B: 4kg, 4 liters, sells for \$4

 There are 4 units available
- Unit of object C: 6kg, 3 liters, sells for \$9

 Only 1 unit available
- What should we take?

Knapsack-type problem instance...

```
maximize 11x + 4y + 9z
subject to
16x + 4y + 6z \le 30
3x + 4y + 3z \le 20
x <= 3
y <= 4
z <= 1
x, y, z \ge 0, integer
```

Knapsack-type problem instance in MathProg modeling language set OBJECT;

- set CAPACITY_CONSTRAINT;
- param cost{i in OBJECT, j in CAPACITY_CONSTRAINT};
- param limit{j in CAPACITY_CONSTRAINT};
- param availability{i in OBJECT};
- param value{i in OBJECT};
- var quantity{i in OBJECT}, integer, >= 0;
- maximize total_value: sum{i in OBJECT} quantity[i]*value[i];
- s.t. capacity_constraints {j in CAPACITY_CONSTRAINT}: sum{i
 in OBJECT} cost[i,j]*quantity[i] <= limit[j];</pre>
- s.t. availability_constraints {i in OBJECT}: quantity[i] <=
 availability[i];</pre>

Knapsack-type problem instance in MathProg modeling language...

```
data;
set OBJECT := a b c;
set CAPACITY CONSTRAINT := weight volume;
param cost: weight volume :=
             16
                 3
 а
 b
            4
                   4
            6
                   3;
 С
param limit:= weight 30 volume 20;
param availability:= a 3 b 4 c 1;
param value:= a 11 b 4 c 9;
end;
```

. . .

used in truckload transportation, industrial procurement, spectrum allocation, ...

The winner determination problem (WDP)

- Choose a subset A (the accepted bids) of the bids B,
- to maximize $\Sigma_{b \text{ in } A} v_{b}$,
- under the constraint that every item occurs at most once in A
 - This is assuming free disposal, i.e. not everything needs to be allocated

An integer program formulation

x_b equals 1 if bid b is accepted, 0 if it is not

maximize $\Sigma_{b} v_{b} \mathbf{x_{b}}$ subject to for each item j, $\Sigma_{b: j \text{ in } b} \mathbf{x_{b}} \leq 1$ for each bid b, $\mathbf{x_{b}}$ in {0,1} WDP in the modeling language

set ITEMS;

set BIDS;

var accepted{j in BIDS}, binary;

param bid_amount{j in BIDS};

param bid_on_object{i in ITEMS, j in BIDS}, binary;

maximize revenue: sum{j in BIDS}
 accepted[j]*bid_amount[j];

s.t. at_most_once{i in ITEMS}: sum{j in BIDS}
accepted[j]*bid_on_object[i,j] <= 1;</pre>

Game theory

- Game theory studies settings where agents each have
 - different preferences (utility functions),
 - different actions that they can take
- Each agent's utility (potentially) depends on all agents' actions
 - What is optimal for one agent depends on what other agents do
 - Very circular!
- Game theory studies how agents can rationally form beliefs over what other agents will do, and (hence) how agents should act

- Useful for acting as well as predicting behavior of others

Penalty kick example

Row player's utility is always listed first, column player's second

Zero-sum game: the utilities in each entry sum to 0 (or a constant) Three-player game would be a 3D table with 3 utilities per entry, etc.

Minimax strategies

- A conservative approach:
- We (Row) choose a distribution over rows
 p_r is probability on row r
- To evaluate quality of a distribution, pessimistically assume that Column will choose worst column for us:

arg min_c $\Sigma_r p_r u_R(r, c)$

- Try to optimize for this worst case: arg max_{pr} min_c $\Sigma_r p_r u_R(r, c)$
- Theoretically very well-motivated in zero-sum

Solving for minimax strategies using linear programming

- maximize u_R
- subject to
 - for any column c, $\Sigma_r \mathbf{p}_r \mathbf{u}_R(\mathbf{r}, \mathbf{c}) \ge \mathbf{u}_R$

 $-\Sigma_r \mathbf{p_r} = 1$

Game playing & Al

perfect information games: no uncertainty about the state of the game (e.g. tictac-toe, chess, Go)

- Optimal play: value of each node = value of optimal child for current player (backward induction, minimax)
- For chess and Go, tree is too large
 - Use other techniques (heuristics, limited-depth search, alpha-beta, ...)
- Top computer programs (arguably) better than humans in chess, not yet in Go

- Player 2 cannot distinguish nodes connected by dotted lines
 - Backward induction fails; need more sophisticated game-theoretic techniques for optimal play
- Small poker variants can be solved optimally
- Humans still better than top computer programs at full-scale poker
- Top computer (heads-up) poker players are based on techniques for game theory

Solving the tiny poker game

Mechanism design

- Mechanism = rules of auction, exchange, ...
- A function that takes reported preferences (bids) as input, and produces outcome (allocation, payments to be made) as output

- The entire function f is one mechanism
- E.g.: find allocation that maximizes (reported) utilities, distribute (reported) gains evenly
- Other mechanisms choose different allocations, payments

Example: (single-item) auctions

- Sealed-bid auction: every bidder submits bid in a sealed envelope
- First-price sealed-bid auction: highest bid wins, pays amount of own bid
- Second-price sealed-bid auction: highest bid wins, pays amount of second-highest bid

Which auction generates more revenue?

- Each bid depends on
 - bidder's true valuation for the item (utility = valuation payment),
 - bidder's beliefs over what others will bid (\rightarrow game theory),
 - and... the auction mechanism used
- In a first-price auction, it does not make sense to bid your true valuation
 - Even if you win, your utility will be 0...
- In a second-price auction, it turns out that it always makes sense to bid your true valuation

Are there other auctions that perform better? How do we know when we have found the best one?

Other settings/applications

Financial securities

- Tomorrow there must be one of
- Agent 1 offers \$5 for a security that pays off
 \$10 if offers or offers
- Agent 2 offers \$8 for a security that pays off \$10 if
- Agent 3 offers \$6 for a security that pays off
 \$10 if
- Can we accept some of these at offers at no risk?

How to incentivize a weather forecaster

$$P(2) = .8$$

 $P(2) = .1$
 $P(2) = .1$

- Forecaster's bonus can depend on
 - Prediction
 - Actual weather on predicted day
- Reporting true beliefs should maximize expected bonus

Kidney exchange

Conclusion

- Students enjoyed course
 - Overall quality rating of 4.78 out of 5
 - No complaints about missing prerequisites
 - One economics student took intro programming the next semester
- Downsides w.r.t. attracting new students:
 - Tends to attract economics students who already have some cs background anyway
 - Tends to attract juniors, seniors

Thank you for your attention!
