

# Introduction to Algorithms

6.046J/18.401J

## Lecture 25

Prof. Piotr Indyk

## Final Exam

- May 19, 2008, 9:00am - 12 pm
- Johnson Ice Rink
- Closed book:
  - two handwritten crib sheets
- Coverage: everything except
  - L17 Hidden Markov Models II
  - L18 Computational Biology
  - L26 Parallel Algorithms
- Quiz review: Fri, 3-5pm, 32-155

Introduction to Algorithms

May 13, 2008 L25.2

## Dealing with Hard Problems

- What to do if:
  - Divide and conquer
  - Dynamic programming
  - Greedy
  - Linear Programming/Network Flows
  - ...
- does not give a polynomial time algorithm?

© Piotr Indyk

Introduction to Algorithms

May 13, 2008 L25.3

## Dealing with Hard Problems

- Idea I: Ignore the problem
  - Can't do it ! There are **thousands** of problems for which we do not know polynomial time algorithms
  - For example:
    - Traveling Salesman Problem (TSP)
    - Set Cover

© Piotr Indyk

Introduction to Algorithms

May 13, 2008 L25.4

## Traveling Salesman Problem

- Traveling Salesman Problem (TSP)
  - Input: undirected graph with lengths on edges
  - Output: shortest cycle that visits each vertex exactly once
- Best known algorithm:  $\Omega(2^n)$  time

© Piotr Indyk

Introduction to Algorithms

May 13, 2008 L25.5

## Set Covering

- Set Cover:
  - Input: subsets  $S_1 \dots S_n$  of  $X$ ,  $\bigcup_i S_i = X, |X|=m$
  - Output:  $C \subseteq \{1 \dots n\}$ , such that  $\bigcup_{i \in C} S_i = X$ , and  $|C|$  minimal
- Vertex cover: special case
  - $X$  = edges
  - $S_v$  = edges incident to vertex  $v$
- Best known algorithm:  $\Omega(2^n)$  time

App: bank robbery

- $X = \{\text{plan, shoot, safe, drive, scary}\}$
- Sets:
  - $S_{\text{steve}} = \{\text{plan, safe}\}$
  - $S_{\text{stevie}} = \{\text{shoot, scary, drive}\}$
  - $S_{\text{sevo}} = \{\text{plan, drive}\}$
  - ...

Introduction to Algorithms

May 13, 2008 L25.6

## Dealing with Hard Problems, ctd.

- Exponential time algorithms for **small** inputs
  - E.g.,  $1.274^n$  time is not bad for  $n < 50$  (such algorithm exists for Vertex Cover)
- Polynomial time algorithms for **some** inputs (e.g., average-case)
- Polynomial time algorithms for **all** inputs, but which return **approximate** solutions

Introduction to Algorithms

May 13, 2008 L25.7

## Approximation Algorithms

- An algorithm  $A$  is  $\rho$ -approximate, if, on any input of size  $n$ :
  - The cost  $C_A$  of the solution produced by the algorithm, and
  - The cost  $C_{OPT}$  of the optimal solution are such that  $C_A \leq \rho C_{OPT}$
- We have seen:
  - 2-approximation algorithm for finding a median string (PS7)
- We will see:
  - 2-approximation algorithm for TSP **in the plane**
  - $\ln(m)$ -approximation algorithm for Set Cover

Introduction to Algorithms

May 13, 2008 L25.8

## Comments on Approximation

- “ $C_A \leq \rho C_{OPT}$ ” makes sense only for minimization problems
- For maximization problems, replace by “ $C_A \geq 1/\rho C_{OPT}$ ”
- Additive approximation “ $C_A \leq \rho + C_{OPT}$ ” also makes sense, although difficult to achieve

## TSP

© Piotr Indyk

Introduction to Algorithms

May 13, 2008 L25.10

## 2-approximation for TSP

- Compute MST  $T$ 
  - An edge between any pair of points
  - Weight = distance between endpoints
- Compute a tree-walk  $W$  of  $T$ 
  - Each edge visited twice
- Convert  $W$  into a cycle  $C$  using shortcuts

© Piotr Indyk

Introduction to Algorithms

May 13, 2008 L25.11

## 2-approximation: Proof

- Let  $C_{OPT}$  be the optimal cycle
  - $Cost(T) \leq Cost(C_{OPT})$ 
    - Removing an edge from  $C$  gives a spanning tree,  $T$  is a spanning tree of minimum cost
  - $Cost(W) = 2 Cost(T)$ 
    - Each edge visited twice
  - $Cost(C) \leq Cost(W)$ 
    - Triangle inequality
- $\Rightarrow Cost(C) \leq 2 Cost(C_{OPT})$

# Set Cover

# Approximation for Set Cover

• Input: subsets  $S_1, \dots, S_n$  of  $X$ ,  
 $\cup_i S_i = X, |X|=m$   
 • Output:  $C \subseteq \{1, \dots, n\}$ , such that  
 $\cup_{i \in C} S_i = X$ , and  $|C|$  minimal

Greedy algorithm:

- Initialize  $C = \emptyset$
- Repeat until all elements are covered:
  - Choose  $S_i$  which contains largest number of **yet-not-covered** elements
  - Add  $i$  to  $C$
  - Mark all elements in  $S_i$  as **covered**

# Greedy Algorithm: Example

- $X = \{1, 2, 3, 4, 5, 6\}$
- Sets:
  - $S_1 = \{1, 2\}$
  - $S_2 = \{3, 4\}$
  - $S_3 = \{5, 6\}$
  - $S_4 = \{1, 3, 5\}$
- Algorithm picks  $C = \text{all sets}$
- Not optimal!

# $\ln(m)$ -approximation

- Notation:
  - $C_{OPT}$  = optimal cover
  - $k = |C_{OPT}|$  (we do not know  $k$ )
- **Fact:** At any iteration of the algorithm, there exists  $S_i$  which contains at least  $1/k$  fraction of yet-not-covered elements
- **Proof:**
  - $C_{OPT}$  covers the (uncovered) elements using  $k$  sets
  - One of those sets must cover  $\geq 1/k$  fraction of yet-not-covered elements
- **Conclusion:** greedy algorithm covers  $\geq 1/k$  fraction of yet-not-covered elements in each step

# $\ln(m)$ -approximation

- Let  $u_i$  be the number of yet-not-covered elements at the end of step  $i=0, 1, 2, \dots$
- We have
 
$$u_{i+1} \leq u_i (1 - 1/k)$$

$$u_0 = m$$
- Therefore, after  $t = k \ln m$  steps, we have
 
$$u_t \leq u_0 (1 - 1/k)^t \leq m (1 - 1/k)^{k \ln m} < m 1/e^{\ln m} = 1$$
- I.e., all elements are covered by the  $k \ln m$  sets chosen by greedy algorithm
- Opt size is  $k \Rightarrow$  greedy is  $\ln(m)$ -approximate

# Approximation Algorithms

- Very rich area
  - Algorithms use greedy, linear programming, dynamic programming
    - E.g., **1.01**-approximate TSP in the plane
  - Sometimes can show that approximating a problem is as hard as finding exact solution!
    - E.g., **0.99**  $\ln(m)$ -approximate Set Cover
