

# Dynamic Programming

A bottom-up solution technique to optimization problems.

The optimal solution is computed from optimal solutions to sub-problems.

Overlapping subproblems.

# Longest Common Subsequence

Given a sequence  $X = x_1, x_2, \dots, x_m$ , another sequence  $Z = z_1, \dots, z_k$  is a **subsequence** of  $X$  if there are indices  $i_1 < i_2 < i_3 \dots < i_k$  such that for all  $j = 1, \dots, k$ ,  $x_{i_j} = z_j$ .

Given two sequences  $X$  and  $Y$ , a sequence  $Z$  is a **common subsequence** of  $X$  and  $Y$  if it is a subsequence of both  $X$  and  $Y$ .

The **longest common sequence (LCS) problem**: Given two sequences  $X$  and  $Y$ , find the longest common subsequence of both  $X$  and  $Y$ .

# Optimal Substructure

Let  $X = x_1, \dots, x_k$ , the  $i$ -th **prefix** of  $X$  is the sequence  $X_i = x_1, \dots, x_i$ .

**Theorem 1.** Let  $Z = z_1, \dots, z_k$  be the LCS of  $X = x_1, \dots, x_m$  and  $Y = y_1, \dots, y_n$ ,

1. If  $x_m = y_n$  then  $z_k = x_m = y_n$  and  $Z_{k-1}$  is the LCS of  $X_{m-1}$  and  $Y_{n-1}$ .
2. If  $x_m \neq y_n$  then  $z_k \neq x_m$  implies that  $Z$  is the LCS of  $X_{m-1}$  and  $Y$ .
3. If  $x_m \neq y_n$  then  $z_k \neq y_n$  implies that  $Z$  is the LCS of  $X$  and  $Y_{n-1}$ .

Let  $c[i, j]$  be the length of the LCS of  $X_i$  and  $Y_j$ .

$$c[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ c[i - 1, j - 1] + 1 & \text{if } i, j > 0 \text{ and } x_i = y_j \\ \text{Max}(c[i, j - 1], c[i - 1, j]) & \text{if } i, j > 0 \text{ and } x_i \neq y_j \end{cases}$$

A top-down solution can be exponential.

A bottom-up approach takes  $O(nm)$  time, since there are only  $nm$  “subproblems” and each can be computed in  $O(1)$  time if the smallest subproblems have already been computed.

**Theorem 2.** *The LCS-Length algorithm terminates in  $O(nm)$  time and computes the correct LCS value.*

# Elements of Dynamic Programming

**Optimal substructures:** A  $k$ -stage optimal solution is computed from  $k-1$ -stage optimal solutions.

**Overlapping substructures:** the same  $k-1$ -stage substructure is used in the computation of a number of  $k$ -stage substructures.
